CE 631–102: Advanced Reinforced Concrete Design (3 credits)

Lectures: Wednesday 6:00pm – 9:05pm (with a 15-minute break mid-way)
Central King Building 222

Instructor: Raj Navalurkar, Ph.D., PE Office Hours: TBD
Rajendra.navalurkar@parsons.com *or by appointment
whenever my office
door is open, come in!*

Prerequisites: an undergraduate course in theory and design of reinforced concrete. A review of basic concepts of elastic and ultimate strength theories and a study of the present design codes. Topics include: design of concrete building frames, two-way slabs, flat slabs, deep beams, and other structural elements using the above two theories

Recommended Texts & Reading

Course Description

Students will learn advanced topics related to the behavior and design of reinforced concrete. The advanced topics include flexural behavior of reinforced concrete, the behavior and design of slender columns and two-way slab systems, the use of strut and tie modeling for design of structural components, frame joints, torsion, and walls.

Course Objectives (General)

By the end of this course, the student will be able to:

General Design: Compare and contrast different methods used for the design of structural concrete; describe the influence of concrete materials and geometry configurations on concrete design; explain fundamental behavior of structural concrete and principles behind select code provisions.

Flexural Behavior: calculate a moment-curvature diagram for a flexural section with and without compression reinforcement; calculate the cracked stiffness of various concrete components and apply them to frame analyses; perform a plastic collapse analysis on indeterminate concrete beams and plot load-deflection behavior; explain with examples why and when ductility is important in structural design.

Shear and Torsion: describe shear force-transfer mechanisms; calculate shear strength of reinforced concrete systems; identify equilibrium and compatibility torsion in structural systems and explain the significance of each; explain the assumptions and derivations for torsion design and detailing using the plastic space truss analysis; design concrete members of various cross section for torsion using the plastic space truss analogy.

Slender Column Behavior & Design: calculate interaction diagrams for compression and bending in concrete columns; perform a sidesway analysis for a concrete frame; design columns and frames using the moment magnifier method.

Two-way Slab Behavior, Analysis & Design: explain the fundamental behavior and load transfer mechanisms of various slab systems for structural concrete buildings in particular two-way slabs; explain and select design layouts for slab systems; perform a yield line analysis of a two-way slab.

Strut and Tie Modeling and Design: identify "B" and "D" regions in various structural components; sketch the flow of forces in "D" regions; plot principal stresses in concrete members using elastic finite element analyses; create strut & tie models for "D" regions; identify locations and details of reinforcement based on strut & tie models as well as check capacity in compression struts and nodes; give examples of how strut & tie modeling may influence structural form and design decisions; apply strut & tie modeling to the design of deep beams, dapped ends and corbels.

Joints and Walls Joints: describe beam-column joint modes of failure, and necessary design considerations to address these failure modes; evaluate the detailing of various beam-column joint designs for expected performance under monotonic and/or cyclic load; describe different types of walls and their applications in structural systems; calculate the capacity of a bearing wall; calculate the flexural and shear capacity of a shear wall.

POLICIES & PROCEDURES

Academic Integrity: It is expected that NJIT's University Code on Academic Integrity will be followed in all matters related to this course. Refer to NJIT's Dean of Students website to become familiar with the Code on Academic Integrity and how to avoid Code violations.

*"Academic Integrity is the cornerstone of higher education and is central to the ideals of this course and the university. Cheating is strictly prohibited and devalues the degree that you are working on. As a member of the NJIT community, it is your responsibility to protect your educational investment by knowing and following the academic code of integrity policy that is found at: <http://www5.njit.edu/policies/sites/policies/files/academic-integrity-code.pdf>.

Please note that it is my professional obligation and responsibility to report any academic misconduct to the Dean of Students Office. Any student found in violation of the code by cheating, plagiarizing or using any online software inappropriately will result in disciplinary action. This may include a failing grade of F, and/or suspension or dismissal from the university. If you have any questions about the code of Academic Integrity, please contact the Dean of Students Office at dos@njit.edu"

Communication: All communication by the Instructor will be done through Moodle. It is your responsibility to check e-mail on a daily basis, and the course page on Moodle regularly.

Lectures/Class: Attendance at all lecture/class periods is expected. During class I will often ask you to work on a problem or brainstorm ideas with the person or people next to you and you will then be called on to provide one of more of your answers. The goal of this in-class work will be to get you started on a problem (not necessarily finish) that we will then discuss. Please turn all cell phones off during class and keep laptops closed.

Handouts: Copies of the notes used in class will be posted on Moodle throughout the semester at least one day before lecture. It is highly recommended that you print out a set of notes to follow along with during lecture, as notes will be filled on these handouts. A “filled in” version of these notes will be posted after class.

Prerequisites: It is assumed that you have a background in elementary reinforced concrete design, structural analysis, mechanics of materials, and statics. Assignments may require you to look up relationships (e.g., given f'_c , you can look up the equation used to estimate E_c if E_c is what you need). You will not necessarily be given every piece of information you need to solve a problem, but enough to be able to solve it with some looking up of expressions or conducting analyses. If you have not taken an undergraduate course in Reinforced Concrete Design from an undergraduate civil engineering department, please inform the instructor.

Homework: Homework will be assigned to encourage further reading, to extend the material presented in lectures, and to provide practice in arriving at engineering solutions to problems. Completion of the homework is an essential part of the learning process. All homework is to be turned in individually unless specified otherwise on the assignment. If you collaborate with a classmate (or two) be sure to state that collaboration and their names at the top of your assignment.

Homework Format: It is expected that all homework be presented in an organized manner; use green, yellow or white engineering paper, one side of each page (clear side, not grid side); begin each problem on a new page and number all pages; staple all homework pages together and have your name written clearly on the front page. An example of an acceptable homework solution is available on Moodle.

Late Homework: Homework will be due at the beginning of class on the date it is due. Late Homework will be accepted up to two days after the due date with a 10% reduction for each day the assignment is late. After that time, assignments will not be accepted.

Homework Solutions: Homework solutions will be posted two days after the homework is due. It is your responsibility to make sure you understand how to solve the problems by attending office hours with the instructor and/or asking questions in class. As with many engineering problems, multiple solutions may be possible. This means that all rational solutions to the assignments will be accepted.

Exams: There will be one in-class exams held during class time and one exam as scheduled by the University Registrar. Both exams count equally.

Homework Grading: All homework will be submitted electronically by students using Gradescope. It is your responsibility to scan your assignment in and upload it to the Gradescope website before 11:59 PM on the day that it is due.

Homework questions will be graded in terms of a nine point scheme based on three categories of format, concept, and execution. All homework questions will be equally weighted in determining your final homework grade.

Format

One (1) point will be awarded if the solution is formatted with a problem statement and a statement on what is required in the solution

One (1) additional point will be awarded if the engineering solution is presented in an organized and neat fashion that is easy to follow along.

One (1) additional point will be awarded if the solution is completed with a boxed-in answer, including a properly formatted drawing if it is requested in the problem statement.

Concept

One (1) point will be awarded if the solution has major errors in the conceptual basis of the solution.

Two (2) points will be awarded if the solution has minor errors in the conceptual basis of the solution.

Three (3) points will be awarded if the solution has no errors in the conceptual basis of the solution.

Execution

One (1) point will be awarded if the solution has two or more math or execution errors.

Two (2) points will be awarded if the solution has one math or execution error.

Three (3) points will be awarded if the solution has zero math or execution errors.

If you believe that an error was made in grading the homework, you should write a short justification of your claim and submit a regrade request through Gradescope. Your homework will be reviewed to address your concern. The deadline for submitting a re-grade request is one week after the homework is returned.

Calculation of Course Grade: A weighted average grade will be calculated as follows:

Homework	15%
Project	15%
Mid-Term Exam	30%
Final Exam	40%

The minimum requirements for final letter grades are as follows:

A = 90%, B+ = 85%, B = 80%, C+ = 75%, C = 65% F < 65%

Note: Grades are not curved. It is theoretically possible for everyone in the class to get an A (or an F). Your performance depends only on how you do and how much you learn, not on how everyone else in the class does. It is therefore in your best interest to help your classmates, while acting within the bounds of the stated academic integrity policy (i.e., NJIT's Code of Academic Integrity).

Instructor Commitment: You can expect the Instructor to be courteous, punctual, organized, and prepared for lecture and other class activities; to answer questions clearly; to be available during office hours or to notify you beforehand if he is unable to keep them; to provide a suitable guest lecturer when they are traveling; and to grade uniformly and consistently.

Students with Documented Disabilities: NJIT is committed to providing students with documented disabilities equal access to programs and activities. If you have, or believe that you may have, a physical, medical, psychological, or learning disability that may require accommodations, please contact the Coordinator of Student Disability Services located in the Center for Counseling and Psychological Services, in Campbell Hall, Room 205, (973) 596-3414. Further information on disability services related to the self-identification, documentation and accommodation processes can be found on the webpage at: (<http://www.njit.edu/counseling/services/disabilities.php>)

Legal Disclaimer: Students' ability to meet outcomes listed may vary, regardless of grade. They will achieve all outcomes if they attend class regularly, complete all assignments with a high degree of accuracy, and participate regularly in class discussions. This syllabus is subject to change at the discretion of the instructor throughout the term.
