Abstract

The reduced equation of state for gases and liquids developed by Benson and Golding in 1951 is modified and used to calculate liquid enthalpy departures for saturated pure substances and mixtures. The temperature-independent coefficients in the modified equation are determined from critical properties and experimental liquid enthalpies at the boiling point and at the critical point. The results of the proposed method are compared with those predicted with the modified Redlich-Kwong equation of state by Joffe and Zudkevitch.

Acknowledgement

I wish to thank Dr. Joseph Joffe, my adviser, for the inspiration and encouragement given me during the whole period in preparing the thesis, and also the faculty members of the Chemical Engineering Department for their support and advice.

Introduction

The enthalpy of a saturated liquid at any given temperature can be obtained from the enthalpy departure evaluated analytically using an equation of state such as the Redlich-Kwong equation with the two coefficients, a and b , treated as temperature-dependent variables (1).

The method applied in this study has its origin in the modified Van der Waals equation developed by S. W. Benson and E. Gerjuoy in 1950 (2) :

$$P = RT/(V - bV^{-s}T^{-n}) - a/(V^mT^p) \quad (1)$$

The various exponents in the equation were evaluated by Benson and R.

A. Golding (3) based on the following criteria:

- (a) Trouton's rule: $E_{\text{vap}}/RT = 9.5$ (at the boiling point)
- (b) Critical ratio: $1/Z_c = RT_c/P_cV_c = 3.70$
- (c) Liquid density rule: $1/\phi_b = 2.72$ (at the boiling point)
- (d) The coefficients of thermal expansion and compressibility at normal boiling points are about $1.3 \times 10^{-3}/^\circ\text{K}$ and $1.5 \times 10^{-4}/\text{atmos.}$ respectively.

The equation with the best choice of exponents becomes:

$$P = RT/(V - bV^{-1/2}) - a/(V^{5/3}T^{2/3}) \quad (2)$$

$$\text{where } a = 0.9099 RT_c^{5/3} V_c^{2/3} \quad (2a)$$

$$b = 0.1567 V_c^{3/2} \quad (2b)$$

and in reduced form:

$$P/P_c = \pi = 3.624 \left\{ \theta / (\phi - 0.1567 \phi^{-1/2}) - 0.9099 / (\phi^{5/3} \theta^{2/3}) \right\} \quad (3)$$

where $\phi = V/V_c$; $\theta = T/T_c$.

It is shown by Benson and Golding (3) that this equation in predicting some physical properties such as liquid densities of non-associated substances, heats of vaporization and gas isotherms gives better results than the Van der Waals and Berthelot equations.

In the current study Equation 2 was applied to the calculation of liquid enthalpy departures of non-polar substances and mixtures. The systems studied were methane, propane, nitrogen, carbon dioxide and methane-propane mixtures. Satisfactory results were obtained with some modifications of the equation. A polar compound, ammonia, was also investigated.

Pure Substances

Liquid enthalpy departure can be calculated using the following thermodynamic relations:

$$(H^* - H)_T = RT - PV + \int_{\infty}^V (P - T(\partial P/\partial T)_V) dV \quad (4)$$

Differentiating Equation 2,

$$(\partial P/\partial T)_V = R/(V - bV^{-1/2}) + 2a/(3V^{5/3}T^{2/3}) \quad (5)$$

Multiplying both sides by T,

$$T(\partial P/\partial T)_V = RT/(V - bV^{-1/2}) + 2a/(3V^{5/3}T^{2/3}) \quad (6)$$

Substituting Equations 2 and 6 into Equation 4:

$$\begin{aligned} (H^* - H)_T &= RT - PV + \int_{\infty}^V \left(RT/(V - bV^{-1/2}) - a/(V^{5/3}T^{2/3}) \right. \\ &\quad \left. - RT/(V - bV^{-1/2}) - 2a/(3V^{5/3}T^{2/3}) \right) dV \\ &= RT - PV - \int_{\infty}^V \left(5a/(3V^{5/3}T^{2/3}) \right) dV \\ (H^* - H)_T &= RT - PV + 5a/(2V^{2/3}T^{2/3}) \end{aligned} \quad (7)$$

where P and T are given, V is calculated from Equation 2 with the constants a and b evaluated from Equations 2a and 2b. Results obtained from Equation 7 for saturated liquid methane, propane, nitrogen and carbon dioxide were compared in the current study with the experimental values (4) and were found to be of low accuracy.

One of the original criteria used by Benson and Golding, the critical ratio, $1/Z_C$, has a generalized value of 3.70, or $Z_C = 0.270$. Since the

critical compressibility factors of most compounds are different from 0.270 (5), one of the exponents was changed in the current study to fit the experimental critical compressibility factor. The modified equation

$$P = RT/(V - bV^{-1/2}) - a/(V^n T^{2/3}) \quad (8)$$

where $a = C_1 RT_C^{2/3} V_C^{n-1}$ and $b = C_2 V_C^{3/2}$, was made to satisfy the following conditions:

$$P_C = RT_C/(V_C - bV_C^{-1/2}) - a/V_C^n T_C^{2/3} = Z_C RT_C/V_C \quad (9)$$

$$\begin{aligned} (\partial P/\partial V)_{C.p.} &= (-RT_C)(1 + \frac{1}{2} bV_C^{-3/2})/(V_C - bV_C^{-1/2})^2 \\ &+ anV_C^{-n-1} T_C^{-2/3} = 0 \end{aligned} \quad (10)$$

$$\begin{aligned} (\partial^2 P/\partial V^2)_{C.p.} &= 3RT_C bV_C^{-5/2} / \{4(V_C - bV_C^{-1/2})^2\} + \\ &2RT_C(1 + \frac{1}{2} bV_C^{-3/2})^2/(V_C - bV_C^{-1/2})^3 \\ &- an(n+1)V_C^{-n-2} T_C^{-2/3} = 0 \end{aligned} \quad (11)$$

By substituting a and b as defined for Equation 8 into Equations 9, 10, and 11, the constants C_1 , C_2 and n can be calculated. The results are listed in Table 1.

Table 1

Constants Used in Equation 8

	Z	C	C	n
CH ₄	0.290	0.910	0.1667	1.715
C ₃ H ₈	0.277	0.910	0.1575	1.670
N ₂	0.291	0.909	0.1670	1.716
CO ₂	0.2745	0.910	0.1558	1.662

The enthalpy departure can be calculated with the following equation:

$$(H^* - H)_T = RT - PV + 5a / \left(3(n-1) v^{n-1} T^{3/2} \right) \quad (12)$$

The above change did not show any substantial improvement in accuracy over Equation 7.

Another trial was carried out by changing another exponent:

$$P = RT / (V - bV^{-m}) - a / (V^{5/3} T^{3/2}) \quad (13)$$

where $a = C_3 RT_C^{5/3} V_C^{3/2}$ and $b = C_4 V_C^{m+1}$

Again, the three conditions at the critical point used before were applied and C_3 , C_4 and m were evaluated. This attempt was likewise unsuccessful, since the change of the exponent of the volume in the first term of the equation has almost no effect on the enthalpy departure.

From the previously calculated results, it was apparent that the deviation from the experimental value becomes larger as the temperature comes closer to the boiling point. Therefore, two exponents were changed to fit the vapor pressure and liquid density data at the boiling point in addition to the three conditions at the critical point:

$$P = RT / (V - bV^{-1/2}) - a / (V^{n-1} T^m) \quad (14)$$

where $a = C_5 RT_C^{m-1} V_C^{n-1}$ and $b = C_6 V_C^{3/2}$; and the enthalpy departure becomes:

$$(H^* - H)_T = RT - PV + (m+1)a / ((n-1) T^m V^{n-1}) \quad (15)$$

This modification did not improve the results significantly. However, from the previous attempts, it was found that the temperature exponent has a greater effect on enthalpy departure than the volume exponent, and that the temperature-enthalpy profile is of an inverse exponential type. Since $e^{-x} = 1 - x/1! + x^2/2! - x^3/3! + \dots$, the exponential can be approximated by omitting the terms after the second one. In order to compensate for the terms omitted, an exponent was added to the second term and a modified temperature function, $(a - dT^m)$, was tried:

$$P = RT/(V - bV^{-1/2}) - (a - dT^m)/V^n \quad (16)$$

$$\text{where } a = C_7 RT_c V_c^{n-1} \quad (16a)$$

$$b = C_8 V_c^{3/4} \quad (16b)$$

$$d = C_9 RT_c^{1-m} V_c^{n-1} \quad (16c)$$

Applying the three conditions of Equations 9, 10 and 11, there is obtained for the enthalpy departure:

$$(H^* - H)_T = RT - PV + \left[a + (m - 1)dT^m \right] / \left[(n - 1)V^{n-1} \right] \quad (17)$$

The three conditions at the critical point and the experimental liquid enthalpies at the boiling point and at the critical point were used to determine C_7 , C_8 , C_9 , n and m for each of the pure substances studied. The polar substance, ammonia, was added to those previously studied. The values are given in Table 2.

To find the enthalpy departure with Equation 17, the following procedure is used: the temperature and vapor pressure of the pure substance are substituted into Equation 16 and the latter is solved for

the liquid volume. The calculated liquid volume is substituted into Equation 17 to obtain the enthalpy departure.

The calculated enthalpy departures are compared with the experimental values as shown in Tables 3-7.

Binary Mixtures

The methane-propane system of three different compositions, 76.6, 5.2 and 12 mole per cent propane-in-methane mixtures, were studied using the proposed method.

The enthalpy departure of each component was calculated at a reduced temperature which is the same as the pseudoreduced temperature of the mixture. The latter is defined as the temperature of the mixture divided by the pseudocritical temperature. The pseudocritical temperature can be established by applying a mixing rule. Two mixing rules were used: Kay's rule (6) and the correlation developed by Yesavage and Powers (7).

The enthalpy departure of the mixture was found as the summation of the enthalpy departures of each component calculated as explained above and multiplied by its mole fraction in the mixture. This procedure for finding a residual property of a mixture has been discussed elsewhere by Joffe (11).

The results are presented in Table 8 along with the experimental values (8,9,10) and the calculations of Joffe and Zudkevitch who used the modified Redlich-Kwong Equation of State with temperature-dependent coefficients (1).

Discussion of Results

The proposed method with the temperature-independent coefficients derived from the Equation of State of Benson and Golding predicts the liquid enthalpy departures in close agreement with the experimental values for the four non-polar, pure substances tested. The maximum absolute deviation is 3.3 Btu/lb (Tables 3 to 6). It also works reasonably well for the non-polar mixtures tested in this study, provided that the proper mixing rule is applied (Table 8). The average deviation of the calculated values is of the same order of magnitude as for the method of Joffe and Zudkevitch.

For the polar substance, liquid ammonia, the calculated enthalpy departure and the experimental value are fairly close at temperatures near the boiling point and the critical point (Table 7). For the temperature range from 280°K to 380°K, the average absolute deviation is approximately 14.9 Btu/lb and the maximum deviation is about 20.6 Btu/lb. This is probably the result of the difference in the temperature-enthalpy profiles for non-polar and polar substances. One possible correction for this deviation is to add another temperature term to the existing ($a - dT^m$) function presently employed. Another possible solution is to make the exponent m , a temperature-dependent one. This will make the enthalpy departure expression very complicated.

Conclusions

For non-polar substances and mixtures, the proposed method gives a quick and fairly accurate estimate of enthalpy departure in the saturated liquid phase up to the critical point.

For polar substances, a better approach is required. This can possibly be done by modifying the temperature function in the second term of the equation.

In general, this empirical equation is simple to use. The coefficients are easily determined from critical properties and experimental enthalpies at the boiling point and the critical point. Even though the procedure is a trial-and-error one, it only takes a few trials to obtain the optimum value of the exponents for each substance.

Nomenclature

a, b, d = coefficients in Benson-Golding and the modified equations

$C_1, C_2, \dots, C_9$ = constants for evaluating coefficients a, b, d

E_{vap} = heat of vaporization

H^* = ideal gas state enthalpy above datum

H = enthalpy of saturated liquid

m, n = exponents in the modified equation of state

P = pressure

P_c = critical pressure

R = gas constant

T = temperature

T_c = critical temperature

V = volume

V_c = critical volume

Z_c = critical compressibility factor

θ = reduced temperature

π = reduced pressure

ϕ = reduced volume

ϕ_b = reduced volume at the boiling point

Pseudocritical Temperatures of Methane-Propane Mixtures

Mole Fraction of Propane in the Mixture	Temperatures in $^{\circ}R$	
	Kay's Rule	Yesavage & Powers (Smoothed Optimum Values)
0.766	590.6	601.5
0.052	360.7	364.3
0.12	382.6	391.5
